

TIE ROD WRENCH

#21 & #22 COMBINATION

88-7813

This special double-ended, extended length wrench was developed to be utilized when adjusting the front tie rods on most ASIAN, EUROPEAN and DOMESTIC automobiles which includes over 29 different automobile manufacturers. The extended length enables the technician to reach into the confined area of the front wheel tie rod and apply additional torque to loosen these often tight tie rod nuts. The open end dimensions of the tool are sized for a close, tight fit on the tie rod nut for a maximum grip. The tool is made from quality steel and comes in a black finish.
